Professional Installation Guide of Ubuntu Server using Oracle VM VirtualBox

1. Introduction

This professional installation manual for Ubuntu Server Installation provides the procedures for deploying and verifying a clean Ubuntu Server virtual machine for our Week 3 Portfolio Project. The installation follows the given laboratory requirements and uses Oracle VirtualBox as the virtualization platform.

The manual covers the preparation of the virtual machine, Ubuntu Server installation, network configuration, hostname assignment, administrative user creation, disk partitioning, OpenSSH installation, and server verification. It is designed to provide a clear step-by-step procedure that another system administrator can follow without requiring additional instructions.

The installation uses the recommended minimum virtual machine specifications provided in the laboratory activity, including 4 GB of RAM, 2 virtual processors, 40 GB of virtual storage, NAT networking, and an Ubuntu Server ISO installation image.

2. Ubuntu Server Installation Guide

This section provides the step-by-step procedure for deploying Ubuntu Server in a virtual machine based on the required laboratory specifications. It covers the virtual machine setup, Ubuntu Server installation, network and hostname configuration, creation of a non-root administrative user, disk partitioning, OpenSSH installation, and completion of the installation. Screenshots are included to document each major installation step.

2.1 Virtual Machine Specifications

Component	Requirement
VM Name	Ubuntu-Server-Week03
RAM	4 GB
CPU	2 Virtual Processors
Storage	40 GB
Disk Type	VDI/VMDK
Network	NAT
Optical Drive	Ubuntu Server ISO

2.2 Installation Tasks

The following procedures describe the required Ubuntu Server installation tasks.

2.2.1 Language

Procedure

1. Start the Ubuntu-Server-Week03 virtual machine.
2. Wait for the Ubuntu Server installer to load.
3. Select: **English**
4. Continue to the next step.

Republic of the Philippines
Laguna State Polytechnic University
Province of Laguna
COLLEGE OF COMPUTER STUDIES

2.2.2 Keyboard Layout

Select the appropriate keyboard layout.

For example: **English (US)**

Then continue.

2.2.3 Network Configuration

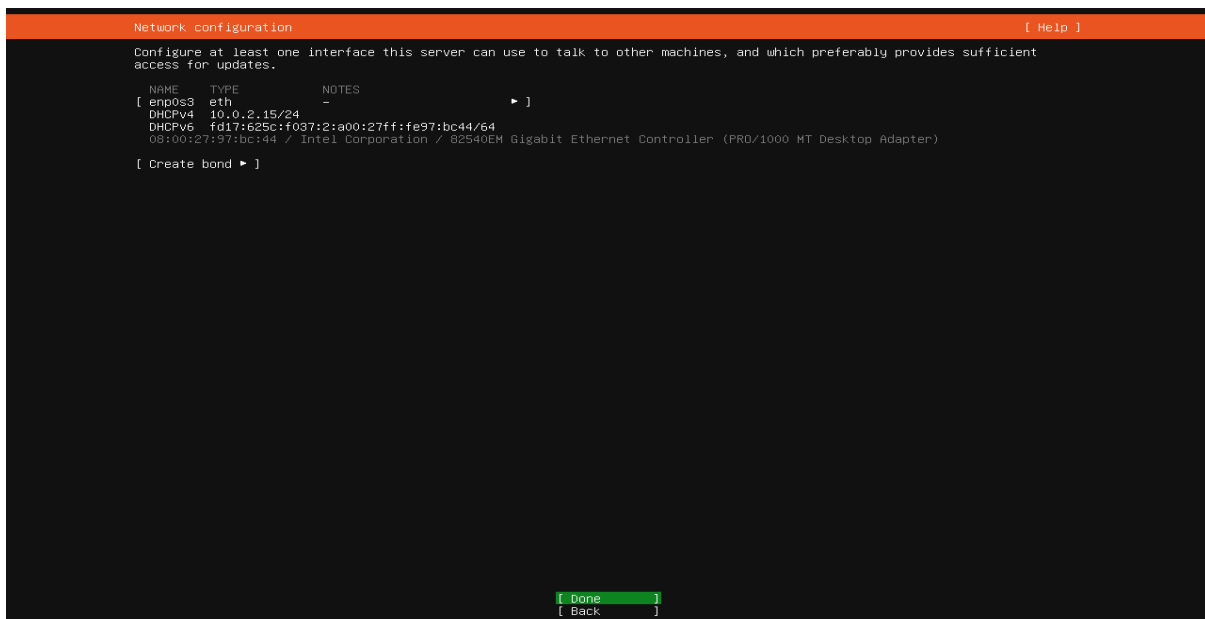

Ubuntu Server should detect the virtual network adapter.

Allow Ubuntu to obtain an IP address automatically.

Important

Record the assigned IP address.

But use the actual IP address assigned to your VM.

2.2.4 Hostname

When Ubuntu asks for the hostname, enter exactly what on the instruction

Do not use ubuntu-server if your laboratory specifically requires server01.

The screenshot shows the 'Profile configuration' window in Ubuntu. It has an orange header bar with 'Profile configuration' on the left and '[Help]' on the right. Below the header, a message reads: 'Enter the username and password you will use to log in to the system. You can configure SSH access on a later screen, but a password is still needed for sudo.' There are five input fields: 'Your name:' with 'John Lester De Rama Matienzo', 'Your servers name:' with 'server01' (a note below says 'The name it uses when it talks to other computers.'), 'Pick a username:' with 'lester_4c', 'Choose a password:' with '*****', and 'Confirm your password:' with '*****'. At the bottom center, there is a '[Done]' button.

2.2.5 User Account

Create a **non-root administrative user**.

This screenshot is identical to the one above, showing the 'Profile configuration' window. It displays the same fields for name, server name, username, password, and password confirmation, with the same values entered: 'John Lester De Rama Matienzo', 'server01', 'lester_4c', and two masked passwords. The '[Done]' button is at the bottom.

2.2.6 Disk Partition

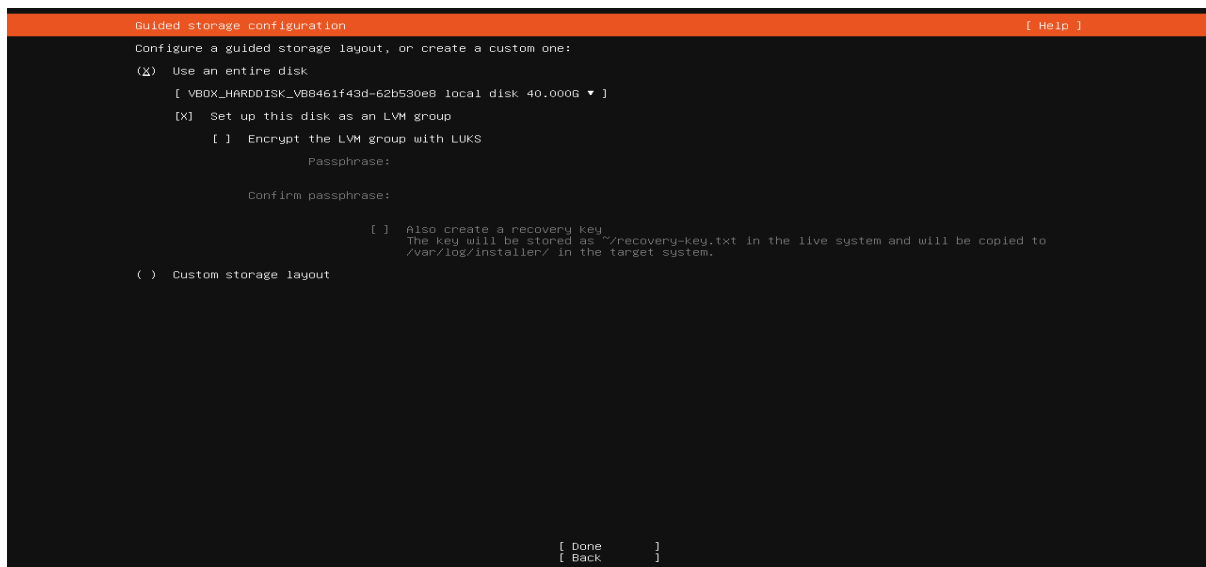

Select:

Guided – Use Entire Disk

Select the 40 GB virtual disk.

Before confirming, document:

- Partition scheme
- File system
- Disk size

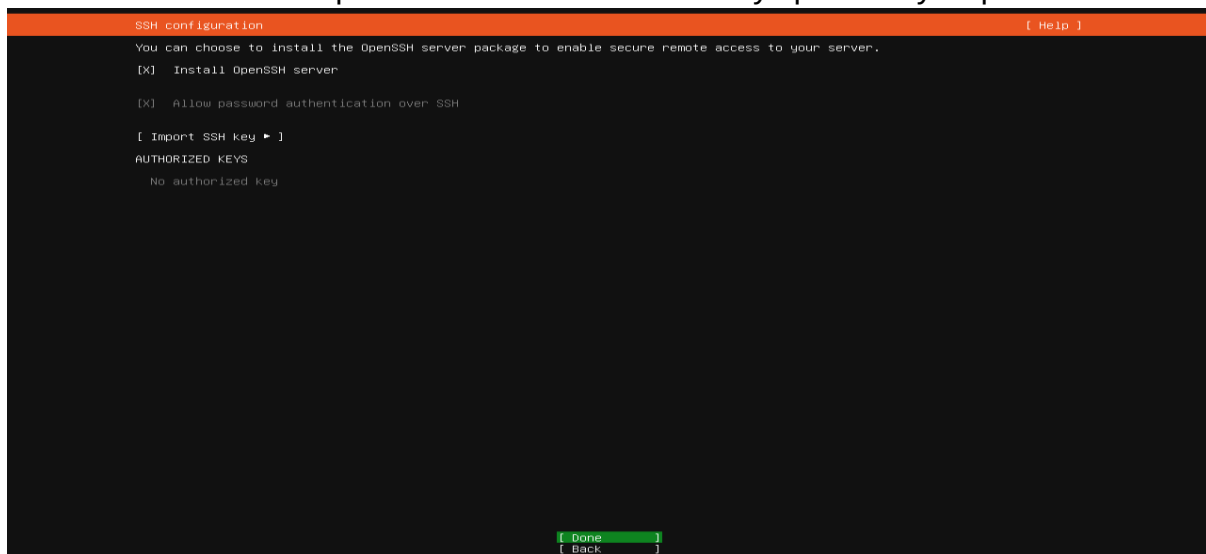

2.2.7 SSH Server

When you reach the SSH configuration screen:

Select: ✓ Install OpenSSH Server

This is important because the laboratory specifically requires SSH.

Do not install additional packages unless instructed.

Don't select extra applications just because they are available.

Wait for the installation to finish.

If Ubuntu tells you to remove the installation media:

1. Remove/detach the Ubuntu ISO from VirtualBox.
2. Restart the VM.

3. Initial Server Configuration

Configuration	Required Setting
Hostname	server01
Administrative User	Non-root user
Network	DHCP
SSH	OpenSSH Server installed
Storage	Guided – Use Entire Disk
Additional Packages	None

4. Server Verification Procedures

This section verifies that the Ubuntu Server was installed and configured correctly. The procedures confirm successful login, hostname configuration, IP address assignment, internet connectivity, system updates, and SSH service operation. Each verification task includes the required command and a screenshot of the result as evidence that the server is functioning properly

4.1 Login

After restarting the VM, log in using the account you created during installation.

```

5. Troubleshooting Guide

Problem	Possible Cause	Solution
Ubuntu ISO takes a long time to download	Slow internet connection or large ISO file	Wait for the download to finish and verify the ISO before attaching it to VirtualBox
VM cannot boot	ISO not attached correctly	Check VirtualBox Storage settings
Internet ping fails	Network or DNS issue	Check ip addr and test connectivity
SSH is not running	OpenSSH was not installed or service stopped	Verify with <code>systemctl status ssh</code>
Wrong hostname	Incorrect hostname entered during setup	Check with <code>hostname</code> and correct the hostname if required
Installation is slow	Limited VM resources	Verify that the VM has at least 4 GB RAM and 2 processors

6. Best Practices

I learned that following best practices during Ubuntu Server installation and configuration is important to keep the server stable, secure, and easier to manage. I made sure that the virtual machine followed the required specifications, including 4 GB of RAM, 2 virtual processors, 40 GB of storage, and NAT networking. I also used a non-root administrative account for normal server administration instead of directly using the root account. After the installation, I updated the system using `sudo apt update` and `sudo apt upgrade` to make sure that the available packages were up to date. I also avoided installing unnecessary packages and enabled only the required service, which was OpenSSH. Lastly, I documented important server information such as the hostname, IP address, SSH status, and verification results. These practices helped me understand how proper server configuration and documentation can make system administration more organized and reliable.
